

Time: 1 hour

Challenge:

Suppose you have an array of timestamps like this:

```
const times = [new Date(), new Date()] // This is an array of different dates
```

We would like you to recreate the following chart:

On the X Axis you can see “hour of day”. All of the times at “12 noon”, for example, are the dates that fall between 12 noon and 1 PM (12-13:00 if you use 24 hours time). The Y Axis contains the count.

You may create your own dataset. It does not need to be complicated - just enough to show that you can create the graph.

Your solution does not need to look *exactly* like the one we have provided, but it should show the same information and be clean.
